Usage

How It Works

When the command `aitalk --help` is executed, the script generates a usage guide that includes all supported commands, their syntax, and a brief description of each. This functionality is implemented in both the bash script and the Python entry point to ensure reliability and provide a fallback mechanism.

Code Explanation

Bash Script Section

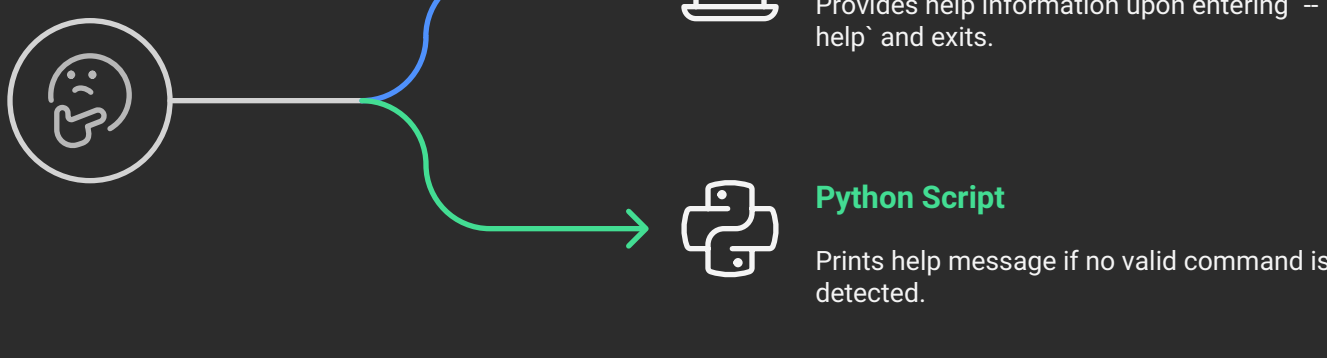

In the bash script, when the user inputs `--help`, the script is programmed to print all available commands and then exit. This ensures that users can easily access the help information without any additional steps.

Python Fallback Section (aitalk.py)

In the Python script (`aitalk.py`), the command is handled similarly. If no valid command is detected, the script will print the same help message, ensuring that users are always informed about the available commands.

```
def main():
    if '--help' in sys.argv:
        print(" aitalk --chat")
        print(" aitalk --status")
        print(" aitalk --help")
```
